SINGLE & DOUBLE GIRDER TOP RUNNING BRIDGES
WITH INDIVIDUAL MOTOR DRIVEN END TRUCKS

SINGLE GIRDER RATED LOADS:
115 mm (4.5”) thru 305 mm (12.01”)

DOUBLE GIRDER RATED LOADS:
160 mm (6.3”) thru 305 mm (12.01”)

Follow all instructions and warnings in building this bridge.

The building of any bridge presents some risk of personal injury or property damage. That risk is greatly increased if proper instructions and warnings are not followed. Before starting construction the builder should become thoroughly familiar with all warnings, instructions and recommendations in this manual.

Retain this manual for future reference and use.

YALE YK & SHAWBOX SK ONLY
YALE/SHAWBOX HOIST PARTS AND SERVICES ARE AVAILABLE IN THE UNITED STATES AND IN CANADA

As a YALE/SHAWBOX Hoist and Trolley user you are assured of reliable repair and parts services through a network of Master Parts Depots and Service Centers that are strategically located in the United States and Canada. These facilities have been selected on the basis of their demonstrated ability to handle all parts and repair requirements promptly and efficiently. To quickly obtain the name of the Master Parts Depot or Service Center located nearest you, call (800) 888-0985, Fax: (716) 689-5644, visit HYPERLINK "http://www.cmworks.com" www.cmworks.com.

LAS PIEZAS Y REPARACIONES DE LOS POLIPASTOS DE YALE/SHAWBOX ESTÁN ASEGURADAS EN ESTADOS UNIDOS Y CANADÁ

Como usuario de un polipasto y carro de YALE/SHAWBOX le aseguramos cualquier reparación o la disponibilidad de cualquier pieza de repuesto a través de una red de almacenes de piezas de repuesto y centros de servicio situados estratégicamente en Estados Unidos y Canadá. Estas instalaciones se han seleccionado en base a su capacidad demostrada en la reparación de equipos y suministro de piezas de repuesto de forma rápida y eficaz. Para obtener la dirección del almacén de piezas de repuesto o del centro de servicio más cercano, llame al teléfono (800) 888-0985. Fax: (716) 689-5644, visita HYPERLINK "http://www.cmworks.com" www.cmworks.com (sólo en Estados Unidos y Canadá).

LE SERVICE DE RÉPARATION ET DE PIÈCES POUR PALANS YALE/SHAWBOX EST DISPONIBLE AUX ÉTATS-UNIS ET AU CANADA

Soyez assurés qu’en temps d’utilisateur de palan et treuil YALE/SHAWBOX, d’un service de réparation et de pièces fiable par l’entremise d’un réseau de Centres de service et de Dépôts de pièces maîtresses qui sont stratégiquement situés aux États-Unis et au Canada. Ces établissements ont été sélectionnés sur une base de leur habileté démontrée à s’occuper promptement et efficacement des besoins de réparation de pièces. Appelez le (800) 888-0985, Fax: (716) 689-5644, visite HYPERLINK "http://www.cmworks.com" www.cmworks.com pour obtenir rapidement le nom du dépôt de pièces maîtresses ou du centre de service situé le plus près.
TO BUILD TOP RUNNING SINGLE & DOUBLE GIRDER CRANE BRIDGES

THE INFORMATION CONTAINED IN THIS MANUAL IS FOR INFORMATIONAL PURPOSES ONLY AND THE MANUFACTURER DOES NOT WARRANT OR OTHERWISE GUARANTEE (IMPLIED OR EXPRESSLY) ANYTHING OTHER THAN THE COMPONENTS MANUFACTURED AND Assumes NO LEGAL RESPONSIBILITY (INCLUDING, BUT NOT LIMITED TO CONSEQUENTIAL DAMAGES) FOR INFORMATION CONTAINED IN THIS MANUAL.

GENERAL

The assembly and manufacturing instructions in this manual are for use in conjunction with the manufacturers components identified by catalog numbers listed in this manual.

The supplied components are designed to conform with the requirements of CMAA 70 Specifications for Top Running Bridge & Gantry Type Multiple Girder Electric Overhead Traveling Cranes & CMAA 74, Specification for Top Running & Under Running Single Girder Electric Traveling Cranes Utilizing Under Running Trolley Hoist and ANSI B30.2 Overhead and Gantry Cranes and ANSI B30.17, Safety Standard for Overhead and Gantry Cranes.

NOTICE

It is the installer’s responsibility to assure that the crane assembly complies in total with all applicable local, state and national codes and standards including those mentioned herein. Crane wiring should be done by a licensed electrician and be in accordance with the National Electric Code (ANSI/NFPA 70).

The crane bridges described in this manual are intended for normal indoor service. Bridges to be used for outdoor or unusual service require special consideration.

This manual illustrates specific configurations for the range of coverage shown, specifically from 10 foot thru 60 foot spans and up to and including 15 tonne single girder capacity and 10 foot thru 50 foot spans and up to and including 20 tonne double girder capacity. Minor deviations to the configurations shown may be made providing that any changes and/or alterations to those shown, be performed only by a properly qualified person. The manufacturer accepts no responsibility for any altered bridge configurations.

WARNING

NON-FACTORY AUTHORIZATIONS OR MODIFICATION OF EQUIPMENT AND USE OF NON-FACTORY REPAIR PARTS CAN LEAD TO DANGEROUS OPERATION AND INJURY.

TO AVOID INJURY:

Do not alter or modify equipment without factory authorization.

Do use only factory provided replacement parts.

Material listed by catalog numbers are applicable only to crane configurations outlined in this manual, specifically limited to a maximum rated load of 15 tonnes and a maximum span of 60 feet for single girder and maximum rated load of 20 tonnes and a maximum span of 50 feet for double girder.

RUNWAYS: Runway beams on which these cranes will operate must be amply strong to support crane bridge, hoisting equipment, rated load and must meet all runway parameters listed in CMAA 70 Specifications for Top Running Bridge and Gantry Type Multiple Girder Electric Overhead Traveling Cranes and CMAA 74 Specification for Top Running and Under Running Single Girder Electric Overhead Cranes Utilizing Under Running Trolley Hoist. Runway rails must be level and parallel. Reference CMAA 70/74 Table 1.4.2-1 for details. Rail joints must be smooth and held firmly in alignment either by bolted splice bars or welding. Rails should be securely fastened to runway beam.

MATERIAL TO BE PURCHASED LOCALLY TO COMPLETE A CRANE BRIDGE

STRUCTURAL STEEL: All structural steel should be first quality, free from rust and excessive mill scale, and conform to ASTM A36, ASTM A 572 or ASTM A 992 Grade 50 Standard Specification for Structural Steel.

BRIDGE GIRDERS

BRIDGE BEAMS: Girder selections can be accomplished by using one of the following methods.

1. COMPASS by Columbus McKinnon offers the product selection and technical guidance you need to quickly and easily find, configure and quote the right product for your application. (https://distributor.cmworks.com/Landing/Compass/default.aspx).

2. Using the girder Selection Tables located in the hoist dimension & specification book for the hoist that you will be using in your bridge crane system.

3. Contact our customer service department for assistance at 800-888-0985.

4. The beam which is selected to be used for the bridge girder must be straight with flanges parallel to each other and flanges 90 degrees to the web. See Figure 1 below.

SHOWING CORRECT BEAM SELECTION

Figure 1.

WARNING

Selection of structural steel beams must be verified by a qualified engineer. IT IS IMPORTANT THAT ALL INSTRUCTIONS BE FOLLOWED AND THAT COMPONENT APPLICATION LIMITS NOT BE EXCEEDED.

NOTICE

Assembly of beam and channel requires welding. IT IS EXTREMELY IMPORTANT TO THE SAFETY OF THIS BRIDGE THAT THIS WELDING BE DONE BY A COMPETENT WELL TRAINED WELDER. It is our strong recommendation that the welder used in this construction be qualified as prescribed by the American Welding Society (AWS) Structural Welding Code - Steel D1.1-2008 and Specification for Welding Industrial and Mill Cranes D14.1 - 2005.
FABRICATION OF GIRDER(S) FOR BRIDGE BEAM WITH CAPPING CHANNEL

Refer to Figure 2. Place channel on supports as shown in Step I. If the beam is sighted for camber and placed with camber in direction shown in Step II, weld one end of the channel to the beam. Clamp, with "C" clamps, the channel to the beam flange. Provide sufficient "C" clamps so as to hold the channel in contact with the beam.

Figure 2.
Weld in accordance with the weld information given, starting at one end, staggering the weld from side to side, proceeding to the opposite end of the channel without interruption. It is important to stagger the weld from side to side in order to retain beam straightness. After welding, draw a taut string from end to end of beam as shown. Beam should either be parallel to string or have some camber. Camber should not exceed deflection of the girder from the dead load plus 1/2 the deflection from the live load.

ASSEMBLING BRIDGE GIRDER TO END TRUCKS
(SINGLE GIRDER ONLY)

1. Refer to figure 5 & 5A, Bridge Bolted Plate End Connection. Make the notch to the dimensions shown with a ½" radius at the intersection of the cuts with a cutting torch or plasma burner and smooth the burned area by grinding. Support beam about two feet from each end on a pair of horses, or other suitable support (adjustable, with clamping ability is preferred). Place beam on supports so that camber side is at top. In case of beams with capping channels the channel side is up. When setting up the beam on supports, make certain that the bottom flange is level, as shown in figure 3.

2. Locate end trucks in the notch of the girder, one at each end of the girder. Make certain trucks are level with each other and are level with the bottom flange of the beam as shown in Figure 3. The girder web is centered on the truck wheelbase. It is quite possible that the top flange of the girder is not level even though the bottom flange is level. DO NOT LEVEL FROM ROUGH TRUCK STRUCTURE. Correct operation of the hoist-trolley requires that the bottom flange is level.

3. To check the distance between the trucks, push all truck wheels in one direction. The distance from the outside of the wheel on one side of the span to the inside of the wheel on the other side of the span should equal the span length, see figure 4. The tolerance on this distance is ±1/32".

Note: A coped girder connection is shown for illustration purposes only. Actual girder connection arrangement may differ by application.

Figure 3.

Figure 4. Checking Wheels

Figure 3.
Figure 5. Bridge Bolted Plate End Connection
Figure 5a. Bridge Bolted Plate End Connection - Single Girder
Figure 5b. Bridge Bolted Plate End Connection - Double Girder

Note: A capped girder connection is shown for illustration purposes only. Actual girder connection arrangement may differ by application.
4. There are measuring dimples available on the face of the truck above the axles. To check the squareness, use a spring scale on the end of a steel tape and measure diagonally across the crane. Then measure across the opposite diagonal with the same force on the scale. These dimensions should be within 1/16" of each other.

Any other method of squaring the trucks that gives comparable results may be used.

After squaring the trucks double check the span at both ends of the trucks.

5. After assuring that the trucks are accurately positioned and squared, complete girder connections as shown in figure 3.

6. Girder Connection plates come bolted and tack welded to the end truck from the factory.

After preparing the connection plates for welding, weld the girder beam on the top connection plate for top mounted girders. For coped girders, weld the girder on both the top and side mounted connection plates. Bottom of the girder beam shall not be below the bottom of the side connection plate as shown in figure 6.

Customer supplied gusset plates shall be welded to the top flange of the girder and top edge of the girder connection plate. If needed, additional customer supplied diagonal bracing may be installed as shown in Figure 5a.

**ASSEMBLING BRIDGE GIRDER TO END TRUCKS (DOUBLE GIRDER ONLY)**

1. Refer to figure 5 & 5B. Bolt Plated End Connection. Make the notch to the dimensions shown with a 1/2" radius at the intersection of the cuts with a cutting torch or plasma burner and smooth the burned area by grinding. Support beam about two feet from each end on a pair of horses, or other suitable support (adjustable, with clamping ability is preferred). Place beam on supports so that camber side is at top. In case of beams with capping channels the channel side is up.

When setting up the beams on supports, make certain that the **top flanges at the trucks are level** as shown in figure 6.

2. Locate end trucks in the notch of the girders, one at each end of the girders. Make certain girders are level with each other and are level at the four points as shown in figure 6.

It is quite possible that the bottom flange of the girders are not level even though the girders are set in accordance with step 2. **DO NOT LEVEL FROM ROUGH TRUCK STRUCTURE.** Correct operation of the hoist-trolley requires that **the top flanges are level**. Girder webs shall be vertical.

3. To check the distance between the trucks, push all truck wheels in one direction. The distance from the outside of the wheel on one side of the span to the inside of the wheel on the other side of the span should equal the span length, see figure 7. The tolerance on this distance is ±1/32".

4. **Figure 7. Checking Wheels**
4. For Squaring Crane there are measuring dimples available on the inside faces of the truck above the axles. To check the squareness, use a spring scale on the end of a steel tape and measure diagonally across the crane. Then measure across the opposite diagonal with the same force on the scale. These dimensions should be within 1/16” of each other.

Any other method of squaring the trucks that gives comparable results may be used.

After squaring the trucks double check the span at both ends of the trucks.

5. After assuring that the trucks are accurately positioned and squared, complete girder connections.

6. Girder Connection plates come bolted and tack welded to the end truck from the factory.

After preparing the connection plates for welding, weld the girder beam on the top connection plate for top mounted girders. For coped girders, weld the girder on both the top and side mounted connection plates. Bottom of the girder beam shall not be below the bottom of the side connection plate as shown on figure 6.

Customer supplied gusset plates shall be welded to the top flange of the girder and top edge of the girder connection.

**COLLECTOR POLE AND BRACKET MOUNTING**

Refer to figure 8 for collector pole and bracket mounting location. Weld collector pole mounting bracket sleeve to the end truck on the drive wheel side closest to the bridge panel. The builder must check to ensure that the proper spacing and location of the collector pole and collectors will clear all obstructions.

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>The trolley frame and bridge frame shall not be considered as electrically grounded through the bridge and trolley wheels and its respective tracks. A 4th runway conductor and collector shall be provided for grounding.</td>
</tr>
</tbody>
</table>

**Figure 8. Main Collector Assembly.**
Figure 9. Bridge Details.
PAINTING
After all welding is completed and prior to installing the cross conductors, wire brush all steel and remove all scale, weld splatter, flux and any other foreign matter. Grease spots are to be cleaned using commercially available solvent. Wash with clear water an area six inches either side of all welds to remove flux residue.

The electrical panel must be closed, and areas such as the switch handle, Off-On identification, drive wheel open spline hole, and nameplate, etc., must be masked prior to painting.

Any national brand zinc-rich, chromate primer may be used and applied according to the manufacturer’s directions. Final coat is recommended to be high gloss enamel, especially suited for steel surfaces and as recommended by any national brand paint manufacturer. Application must be in accordance with manufacturer’s recommendations.

MARKINGS
Codes require that the capacity of the bridge be shown on both sides of the crane, legible from the floor. Normal practice for marking is to use capacity in tons. For example: 1 TON, 2 TON, etc. Stencil forms are readily available that may be used with brush on or spray-can paint. Commercially available block letters and numerals with adhesive backing could also be used. Selection of size should be such that the sign can be easily read from the operating floor.

The builder’s name shall also be placed on the crane in a prominent location along with a serial number or other means of crane identification.

NOTICE
The crane builder and user are responsible for marking the crane and also to check for compliance with all local, state and national codes.

INSTRUCTIONS FOR ASSEMBLING INDIVIDUAL DRIVES TO END TRUCKS
1. The gearmotor and brake are shipped as an assembly. Bolt this assembly to the drive wheel bearing cage with the supplied four hex head bolts with lockwashers. Using a torque wrench, tighten all bolts to 7.5 lb. ft. torque for 115 mm (4.5") and 160 mm (6.3") end trucks, 18 lb. ft. torque for 200 mm (7.9") and 260 mm (10.2") end trucks and 62 lb. ft. torque for 305 mm (12.01") end trucks.

2. The electrical enclosure and fused disconnect switch is to be mounted where required by the crane builder. Assure all clearances.

INSTALLING END STOPS
1. Locate and weld trolley stop angles or install end stop assemblies in the desired position on the girder depending on your application as shown on figure 9.

2. Ensure that the trolley stop angles or end stops are positioned to make contact with the trolley bumpers.

3. If you are installing the adjustable end stop assemblies, once they are positioned correctly, tighten the flange adjustment nut to 48 ft. lbs. torque and the clamping nut to 207 ft. lbs. torque.

WARNING
Trolley stops (clip angles) or end stop assemblies must be installed on both ends of the bridge beam to prevent hoist trolley from running off the end of the beam, which could result in injury to the operator and others and damage to the load and other property.

PUSH BUTTON SYSTEM
The preferred way of operating the controllers on the crane from the floor is a festooned system sold as a kit. This is to be installed as shown in the literature supplied with this system.

REMOVAL OF GIRDER FROM END TRUCKS
(IF REQUIRED FOR SHIPPING)
1. Because the girder connection plates are tack welded at the factory, these tack welds must be removed by grinding before the girder & plates can be removed.

2. Before the top girder connection plate can be removed, the positioning roll pins (top plate only) must be removed. Using a metal punch and hammer, drive the 8mm roll pin through the plate and end truck. The pin should drop into the inside of the end truck tube. Locate and save these pins for assembly.

3. After tack welds and roll pins are removed, all girder connection plate nuts & bolts can be removed.

4. The girder and plates can now be safely removed from the end trucks.

RE-INSTALLING GIRDER & CONNECTION PLATES TO THE END TRUCKS
1. Position the girder and connection plates onto the end trucks.

2. Using the roll pins that were removed during girder removal, drive the roll pins into the top connection plates into the end ruck tube until flush with top of connection plate.

3. The connection plate bolt holes should now be lined up with the bolt holes in the end truck.

4. Using a wrench or socket, tighten all nuts onto the bolts, using a torque wrench, tighten all nuts to 160 lb. ft. torque for 115 mm (4.5") & 160 mm (6.3") end trucks (M16 class 8.8), 325 lb. ft. torque for 200 mm (7.9") & 260 mm (10.2") end trucks (M20 class 8.8) and 325 lb. ft. torque for 305 mm (12.01") end trucks. (M20 class 8.8)

CRANE INSTALLATION
Prior to the start of any crane erection the building should be measured for spans of rails and clearances. These measurements should be checked against the corresponding crane measurements to insure correctness of “fit”. After assurances that the crane fits the building, determine orientation of the crane position with respect to the runway.

These types of cranes are usually lifted into position on the runway rails in one piece.

Immediately after the crane is placed on the runway rails check wheel flange clearances to the rail. Clearance between side of rail head and inside flange of wheel will vary from 3/8" to 1-1/8" depending on the wheel and rail combination and whether or not the truck is centered on the rail. Total wheel float should not be less than the 3/4" recommended by CMAA Specification #70.

NOTE: It is suggested that the trolley and hoist be installed on the crane bridge at this time so that all wiring connections can be completed.

FUSE AND MAINLINE DISCONNECT PANELS
Mainline disconnect panels and fuse bridge control panels are provided as options to assist users in complying with OSHA codes. When ordering with crane, they will be completely installed inside of electrical enclosures.
Electrical service is to be connected to the crane equipped with fuse panels and mainline disconnect panels as shown in the proper wiring diagram. Wiring diagrams are shown on figure 10.

**CAUTION**

Power supply must be same voltage, frequency and phase as specified on crane motor nameplate.

**BEFORE PLACING CRANE IN OPERATION**

1. Load testing the crane shall be performed in accordance with ANSI/ASME B30.2 or B30.17, local, state and/or provincial codes and regulations. A written report should be prepared during the performance of this test and placed on file.

2. Please refer to the Operation, Service and Parts Manual #115326-19 for complete operation, service and maintenance information before placing the crane in service.

**LUBRICATION**

See Operation, Service and Parts Manual (115326-19)

### Notes
INSTALLATION OVERVIEW

1. Clamp cross arms to supporting I-beam. Spacing between arms must not exceed 6’ (1.8m) on center. Securely tighten clamps. **Note:** Use channel J Clips (provided) for both cross arms and control box support rails if beam is capped with channel - must purchase J Clips separately.

2. Hang festoon rail sections from bottom of arms using anchor brackets (one each end of system) and track brackets. Use joint assembly to join track sections. Check to make sure bent tabs on top of c-track are seated within slot on top of joint assembly, and view through middle hole on joint to make sure both sections of track are inserted halfway with no gap. Carefully level and align track. Securely tighten all bolts on joint assembly.

**Note:** Festoon systems come in ten foot increments. If required, cut off last c-rail sections. If more than 5’ is cut off, it may also be necessary to remove one trolley and adjust cable loops accordingly.

3. Insert end stop into ends of tracks opposite fixed end. Clamp tightly in place.

4. Insert tow trolley and position tow arm in trolley pocket. Insert junction box trolley into fixed end. (See illustrations above).

5. Plug connectors on cable assemblies into control box, crane or pendant control.

6. Snap on wire tie clips at desired locations.

7. Install Tow Arm Kit as shown on opposite side.

TOW ARM INSTALLATION

1. Move festoon tow trolley into position next to hoist plug and play connector bracket.

2. Remove the two M8x25 hex head bolts which attach this connector bracket to the hoist.

3. Insert each hex head bolt through the tow arm and connector bracket and assemble both onto the hoist frame. Threadlocker is recommended.

4. Loosen tow arm set screw and adjust the position of the tow arm to be in the center of the tow trolley opening.

5. Slowly run hoist through entire length of travel. Check for binding in the tow trolley opening or obstruction to tow arm.
MOUNTING PREPARATIONS

Refer to page 15, figure 10 to familiarize yourself with the arrangement of a finished system before starting. Then determine which end of the crane the bridge control panel will be mounted at as shown in figure 11. This is the starting point of the system where all cables connect into the bridge control panel and is to be at the main collector end of the bridge.

Once it is known how the system will be mounted on the bridge mark the top flange of the girder to indicate the mounting locations of the track and panel support arms. The festoon track support arms are to be spaced at 5' - 0" center-to-center (no more than 6' - 0") beginning 18" in from the end of the bridge girder.

The bridge control panel support arms are only for the support of the panel and can be mounted on the same side as the festoon conductor tracks or on the opposite side. The bridge panel support arms are to be mounted centered at 12" to align with the track nuts in the top of the panel’s enclosure. The panel must be mounted so as to clear any obstructions (end trucks, bracing and hoist) yet close enough for the festoon cables, motor power connection cables and main collector cable to reach the panel.

C-RAIL MOUNTING TO BRIDGE GIRDER

Rail mounting with support arms on the upper flange connection cables and main collector cable to reach the panel.

To mount the track support arms slide two girder clips into the support arm as shown in figure 12. Do not tighten the clip bolts, spread them apart enough to allow straddling the top flange of the bridge beam, extend the arm to the required distance and tighten the girder clip bolts. For single girder applications, if a capping channel with deep legs is used special J clips are required (sold separately) to mount the support arms to the top flange.

For double girder applications, you must weld the support arm bracket under the top beam flange as shown in figure 13 & 14.

Once the track support arms are secured to the bridge girder’s top flange slide in two track support brackets into each arm, one for the festoon cross conductor track and one for the festoon pendant station track. Position and space the brackets to the required distance and spacing and tighten the bolts.

Then slide the long runs of track into the support brackets, couple the ends of the track together (joint assemblies used on spans greater than 20’) and tighten the hardware to secure the track.

MOUNTING OF FESTOON END STOPS IN THE TRACKS

Install the end stops in the rail at the ends opposite the bridge control panel.

Hanger Assembly - Low Profile

The track support brackets are slipped onto the C rail and mounted to the support arm with the rail as shown in figure 15. Look for tab on c-track to snap into slot on joint assembly. The second joint assembly is slid halfway onto the first C-track rail. Look for tab on c-track to snap into slot on joint assembly. The second
C-track rail piece is inserted into joint assembly, with tab on c-track snapping into slot. Verify C-track pieces are halfway by viewing through middle hold of joint assembly. Clamp joint assembly with no gap remaining between the two C-track rails. The C-rails need to be cut at a right angle and deburred. Be sure that the locking screws are tightened equally to avoid any displacement of the rails in the coupler area.

**End Stop Assembly**

![End Stop Assembly Diagram](image)

Figure 18.
The end stop is inserted into the C rail and clamped at the end of the travel distance of the festoon as shown in figure 18.

**End Cable Clamp**
The end clamp is inserted behind the end stop and then clamped tightly as shown in figure 19.

![End Cable Clamp Diagram](image)

Figure 19.

**INSTALLATION OF THE CABLE SYSTEMS**

**Festoon cable systems**
A flat cable festoon system is comprised of two runs of track running the length of the crane bridge with trolleys carrying flat cables for power and control transmission. For single girder applications, the track closest to the bridge girder contains the festoon cross conductors that supply power and control to the hoist and trolley, the other is for the festoon control pendant station. For Double girder applications, the pendant track is closest to the bridge girder and power & control is on the outside for connecting to top arm.

There are two sets of cables provided with carrier trolleys and connection plugs mounted for easy installation. The festoon cross conductor cable assembly has a tow trolley with an extended “pocket” for the trolley’s tow arm and plugs marked 1 & 3 and 2 & 4. For single girder this arrangement goes in the track closest to the bridge girder, tow trolley end first (outside for double girder). The festoon control pendant cable assembly has a control trolley where the pendant cable plugs into at one end. The control trolley end goes in first.

Each run of festoon track is provided with an end stop for one end to prevent the cable trolleys from running out and a cable end clamp for mounting at the bridge control panel end of the track to secure the cable.

**Motor, main collector connection cables.**
In addition to the trolley suspended festooned cables there are three round (SO) power connection cables shipped in a separate package. One is a 15’ - 0” long cable with a single connection plug for the bridge panel and leads to wire into the main collectors. One is a 10’ - 0” long cable with two connection plugs to connect the bridge girder, tow trolley end first (outside for double girder). The festoon control pendant cable assembly has a control trolley where the pendant cable plugs into at one end. The control trolley end goes in first.

**Control pendant station**
The pendant station SO control cable is wired into a plug half that facilitates easy connection plugging into a mating half on the control trolley. There is also a strain reliever cable running alongside and attached to the SO cable with the cable’s termination wrapped around a thimble ("tear-drop" fitting) and secured with a clamp.

The strain reliever cable must be attached to the eyebolt on the control trolley and shorted if required to provide slack in the control cable prevent it from being torn out of its’ plug. To shorten and attach the strain cable to the control trolley, loosen up the cable clamp and remove the cable from the clamp. Then slip the thimble fitting and cable over the control trolley eyebolt. After this step is complete, pull the strain reliever cable up over the fitting and through the eyebolt until the SO control cable has adequate slack and tighten the strain reliever cable clamp.

**Bridge Panel Mounting**
The bridge control enclosure has four (4) holes in the top for the mounting hardware that consists of four (4) sets of a bolt.

**Notes**

- (2) 16-SC or 16-12C Flat Control Cables (Stacked)
- 16-SC or 16-12C and 4, 6, 8, 10, 12 or 14-SC Flat Cable (Two Cables Stacked)
- Track Splice
- Trolley-Splice
- Cross Arms W/Beam & Channel Clamps & Hanger Brackets
- End Clamp-Flat Cable
- Bridge Enclosure
- Wire Tie Clip every 5 ft.
- TOW TROLLEY TOW ARM KIT Included (see below)
The festoon kit comes with four 1-inch long bolts for hanging the bridge panel as shown in figure 19. Insert each bolt with a lock washer and the sealing rubber washer through the panel from the inside with the threads facing the outside. Make sure the rubber side of the washer is against the panel to maintain the type 4 rating. Twist a square nut on each bolt two or three full turns. Hang the bridge panel by sliding the square nuts onto the track. Tighten the bolts from inside the panel.
Figure 22. Interconnection Wiring Diagram
Yale YK Series/Shawbox SK Series

Please Note:

Festooning length is calculated based on required bridge span with festooning mounted on same side of beam as bridge panel.

In Figure 23 and Figure 24, the bridge panel is displayed in line with the pushbutton festoon. In Figure 25, the bridge panel is displayed opposite of the festooning. When constructing the system per Figure 24, which shows staggered cross-arms along the length of the beam, the cables will need to pass over the girder to the panel and additional cross-arms, hardware and festooning is required. If festoon mount for any variation other than Figure 23 is preferred, please contact the Customer Service Department for quotation.

⚠️ WARNING

DO NOT UNPLUG CONNECTORS WHILE CIRCUIT IS ENERGIZED.

BEFORE PLUGGING IN CONNECTORS REMOVE POWER FROM SYSTEM

⚠️ WARNING

Working in or near exposed energized electrical equipment presents the danger of electric shock.

TO AVOID INJURY:
Disconnect power and lockout/tagout the disconnecting means before removing cover or servicing this equipment.

INDECISION AND SAFE OPERATION

Buyer shall comply with and require its employees to comply with directions set forth in instructions and manuals furnished by Seller and shall use and require its employees to follow such instructions and manuals and to use reasonable care in the use and maintenance of the Goods and any Replacement Parts. Buyer shall not remove or permit anyone to remove any warning or instruction signs on the Goods or Replacement Parts. In the event of personal injury or damage to property or business arising from the use of the Goods or Replacement Parts, Buyer shall within 48 hours thereafter give Seller written notice of such injury or damage. Buyer shall cooperate with Seller in investigating any such injury or damage and in the defense of any claims arising therefrom.

If Buyer fails to comply with this section or if any injury or damage is caused, in whole or in part, by Buyer’s failure to comply with applicable federal or state laws, rules or regulations safety requirements, Buyer shall indemnify and hold Seller harmless against any claims, loss or expense for injury or damage arising from the use of the Goods and/or Replacement Parts.

CMCO Warranty (HOISTS)

A. Columbus McKinnon Corporation (“Seller”) warrants to the original end user (“Buyer”) that, for a period of one (1) year from the date of Seller’s delivery of the goods (collectively, the “Goods”) to the carrier, the Goods will be free from defects in workmanship and materials. In addition, Seller warrants to Buyer that, for a period of one (1) year from the date of their delivery by Seller to the carrier, any aftermarket or replacement parts, accessories or components purchased by Buyer with respect to any Goods (collectively, “Replacement Parts”) will be free from defects in workmanship and materials.

B. In the event of any breach of any such warranty, Seller’s sole obligation shall be exclusively limited to, at the option of Seller, repair or replacement, F.O.B. Seller’s point of shipment, of any Goods or replacement parts that Seller determines to have been defective or, if Seller determines that such repair or replacement is not feasible, to a refund of the purchase price upon return of the or replacement parts to Seller. No claim against Seller for any breach of such warranty with respect to the electrical components of any Good or any Replacement parts, shall be valid or enforceable unless Buyer’s written notice thereof is received by Seller within one (1) year from the date of Seller’s delivery to the carrier and (ii) such warranty with respect to the mechanical components of any Good shall be valid or enforceable unless Buyer’s written notice thereof is received by Seller within one (1) year from the date the date any alleged claim accrues; or (iii) such warranty with respect to the Electrical Components of any Good shall be valid or enforceable unless Buyer’s written notice thereof is received by Seller within one (1) year from the date the date any alleged claim accrues. Except for the warranties set forth above, Seller makes no other warranties with respect to the Goods or any Replacement Parts, whether expressed or implied, including any warranties of merchantability, fitness for a particular purpose, quality and/or those arising by statute or otherwise by law or from any course of dealing or use of trade, all of which are hereby expressly disclaimed.

C. In no event shall Seller be liable to Buyer or any third party with respect to any Good or Replacement Part, whether in contract, tort or other theory of law, for loss of profits or loss of use, or for any incidental, consequential, special, direct or indirect damages, howsoever caused. Seller’s maximum liability to Buyer with respect to the Goods or any Replacement Part shall in no event exceed the price paid by Buyer for the Goods or Replacement Part that are the subject of the applicable claim.

D. Seller shall not be liable for any damage, injury or loss arising out of the use of the Goods or any Replacement Part if, prior to such damage, injury or loss, such Goods or Replacement Parts are: (1) damaged or misused following Seller’s delivery to the carrier; (2) not maintained, inspected, or used in compliance with applicable law and Seller’s written instructions and recommendations; or (3) installed, repaired, altered or modified (a) with any part or accessory other than those supplied by Seller or (b) without compliance with such laws, instructions or recommendations.

E. This warranty is limited and provided only to the original end user. Each Good and Replacement Part must be registered within sixty (60) days of receipt of each product to establish eligibility. Please register at www.cmworks.com/hoist-warranty-registration or submit registration card via US mail.

F. Any action against Seller for breach of warranty, negligence or otherwise in connection with the electrical components of any Good must be commenced by Buyer within one (1) year after: (a) the date any alleged claim accrues; or (b) the date of delivery of the Goods to Buyer, whichever is earlier. Any action against Seller for breach of warranty, negligence or otherwise in connection with the mechanical components of any Good must be commenced by Buyer within one (1) year after the date any alleged claim accrues. Any action against Seller for breach of warranty, negligence or otherwise in connection with any Replacement Part must be commenced by Buyer within one (1) year after: (y) the date any alleged claim accrues; or (z) the date of delivery of the Replacement Part to Buyer, whichever is earlier.

G. This warranty is contingent upon Buyer’s proper maintenance and care of the Goods and/or Replacement Parts, and does not extend to normal wear and tear. Seller reserves the right, at its option, to void this warranty in the event of Buyer’s use with the Goods and/or Replacement Parts of parts or accessories other than those supplied by Seller.

WARNING

Alterations or modifications of equipment and use of non-Seller replacement parts can lead to dangerous operation and injury.

To avoid injury:
• Do not alter or modify equipment.
• Do use only replacement parts manufactured by Seller.
